                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a peptide derived from a transcription factor capable of acting as a marker of the invention.
                                                                                                                        AAW12798 and AAW12799 represent antigenic peptides derived from type 0 foot and mouth disease virus. The reactivity of these peptides was examined by an indirect enzyme antibody method using bovine serum from foot and mouth disease infected cattle. The peptides were combined with horse globulin to give antigens A and B. These sequences can be conjugated to a carrier and used in the diagnosis and treatment of foot and mouth disease. Using these sequences foot and mouth disease can be sequences foot and mouth disease can be sequences foot and mouth disease can be

side chain, and whose specific peptides (AAM52707-AAM32//2 hydroxymethyl), or OH.
The invention also encompasses specific peptides (AAM52707-AAM32//2 AAM52776) conforming to the above formula; esters, amides or AAM52726-AAM52776) conforming to the above formula; esters, amides or salts of peptides of the invention; and pharmaceutical agents containing these peptides of derivatives. The peptides are used as agents to control these peptides of derivatives. The peptides are used as agents to control these peptides of derivatives. The peptides are used as agents to control these peptides of derivatives.
                                                                                                                                                                                                                                        substituted in the side chain; X4 is a peptide bond, a neutral amino acid optionall side chain, or an aromatic amino acid; and X5 is an amino acid or a dipeptide (both optionally side chain, and whose C terminal carboxy may be reduced to the state of the side chain, and whose C terminal carboxy may be reduced to the side chain, and whose C terminal carboxy may be reduced to the side chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to peptides rich in arginine and proline which are recognised as ligands by the G protein-coupled receptor (GPCR) APJ (AAM52725). The peptides of the invention are at least 11 amino acids long, and contain two proline (Pro) residues, two arginine (Arg) residues, a leucine (Leu) residue and a phenylalanine (Phe) residue. The have the general formula:
                                                                                                                                                                                                                                                                                                                                                                                                           in the side chair X3 is a neutral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           X1-Arg-Pro-Arg-Leu-Phe-X2-X3-Gly-Pro-X4-X5 where:
X1 is H or a chain of 1-25 amino acids all option
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein-coupled receptor protein, useful for treating system, immune, digestive, metabolic and reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Parkinson's disease; Huntington's disease; Pick's disease; circulation; heart; immune system; digestion; metabolism; diabetes; reproduction; disorder; tumour; cancer; HIV infection; human immunodeficiency virus; AIDS; acquired immunodeficiency syndrome; cardiant; vulnerary; immunostimulant; antiviral; neuroprotective; nootropic; antiparkinsonian; antialcoholic; cytostatic; antidiabetic; tranquiliser; antidepressant; anticonvulsant; antilipaemic; antirheumatic; antiarthritic; antiinflammatory; dermatological; osteopathic; antiarthritic; antiarteriosclerotic; hypertensive; hypotensive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hyperlipidaemia; hyperprolactinaemia; hypoglycaemia; diabetes; pancreatitis; secretory, metabolic or toxic disorders (such as thyroid hormone or vitamin B12 deficiency, pitultary deficiency, or alcohol, pharmaceutical or heavy metal poisoning); hyperphagia; polyphagy; infections (such as slow virus diseases and Creutzfeld-Jacob disease); tumours; kidney disease; trauma; bone fracture; osteoporosis; rheumatoid arthritis; asthma; atopic dermatitis; Turner's syndrome; and infertility. The peptides may also be used as hypertensives and hypotensives, as agents for treating eye pain, and for improving postoperative nutrition. Sequences AAM52707-AAM52722 and AAM52726-AAM52776 represent specifically claimed APJ GPCR ligand peptides of the invention.
                                                                                                                                                                                                                                   Vaccines against foot and mouth disease virus fragments of nonstructural viral proteins
                                                                                                                                                                                                                                                                                                                                                                                Correa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sus scrofa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   system, digestion, metabolism or reproduction. They can also be used for the prevention and treatment of human immunodeficiency virus (HIV) infection and acquired immunodeficiency syndrome (AIDS). The peptides useful for the prevention and treatment of age-related dementias and Alzheimer's, Parkinson's, Huntington's and Pick's disease; nervous disorders; anxiety or depression; epilepsy; cerebrovascular disorders, acute myocardial infarction; hypercholesterolaemia, arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardial infarction; hypercholesterolaemia, arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardial infarction; hypercholesterolaemia, arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardial infarction; hypercholesterolaemia; arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardia infarction; hypercholesterolaemia; arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardia infarction; hypercholesterolaemia; arteriosclerosis; huntington's procession; epilepsy; cerebrovascular disorders; acute myocardia infarction; hypercholesterolaemia; arteriosclerosis; hypercholesterolaemia; arteriosclerosis; hypercholesterolaemia; acute myocardia infarction; hypercholesterolaemia; arteriosclerosis; hypercholesterolaemia; acute myocardia infarction; hypercholesterolaemia; arteriosclerosis; hypercholesterolaemia; hypercholesterolaemia; hypercholesterolaemia; hypercholesterolaemia; hy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-SEP-1996;

This conjugate may be used in an AIDS vaccine which may be used pre-and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due t sunburn, to maintain organs before transplantation, for supporting cel culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be use as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, an in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 29 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to albumin fusion proteins comprising a therapeutic protein x and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein x. The albumin extends the shelf-life of protein x, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. alzahelmer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders feedom proteins of the invention. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exonucleic acid probe of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

Human peptide

encoded by genome-derived

single exon

probe

SEQ ID

```
The invention relates to a spatially-addressable set of single exon CC nucleic acid probes for measuring gene expression in a sample derived CC from human lung comprising single exon nucleic acid probes having one of CC 12614 nucleic acid sequences mentioned in the specification, or their CC complements or the 12387 open reading frames derived from the 12614 CC probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a CC nucleic acid expressed in the human lung; measuring the next sequences comprise derived from human lung; measuring the array with the carray identifying exons in a eukaryotic genome, comprising the array; identifying exons in a eukaryotic genome, comprising coff the array; identifying exons in a eukaryotic genome, comprising coff the eukaryote; and (b) measuring the label detectably bound to each probe of the eukaryote; and (b) detecting specific hybridisation of detectably coff in the above mentioned microarray; assigning exons, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, and (b) measuring the expression of each of the exons in the tissues and/or cell types using hybridisation to a single exon probe with exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the exons should be assigned to a single gene; a peptide comprising one coff 12011 sequences, mentioned in the specification, or encoded by the exons human lung derived mRNA and for the study of lung diseases (COPD), interstitial lung disease (IID), familial idiopathic pulmonary diseases. Hermansky-Pudlak syndrome, sarcoidosis, pulmonary disease, croman protensis, pulmonary disease. The proses are sequence is a peptide/protein and hyaline membrane disease. The present sequence is a peptide/protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δÃ
              The invention relates to isolated polynucleotide (I) and (C) polypeptide (II) sequences. (I) is useful as hybridisation probes, (C) polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (C) polynucleotides are also used in diagnostics as expressed sequence tags (C) polynucleotides are also used in diagnostics as expressed sequence tags (C) polynucleotides are also used in tiasues expressed sequence tags (C) in tissues to restore normal activity of (II) or to treat disease states involving (C) (II). (II) is useful for generating antibodies against it, detecting or (C) (II). (II) is useful for generating antibodies against it, detecting or (C) (II). (II) and its binding partners are useful in medical activation of sites expressing (II). (I) and (II) are useful for treating (C) imaging of sites expressing (II). (I) and (II) are useful for treating (C) the polypeptide and polypucleotide sequences have applications in (C) the polypeptide and polypucleotide sequences have applications in (C) the polypeptide and polypucleotide sequences have application of mutations (C) and to produce other types of data and products dependent on DNA and (II) and control action of the forestic manner of the forestic manner of the forestic movel human (C) therefore the forestic manner of the forestic movel human (C) the forestic manner of the forestic movel human (C) the forestic manner of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Considers involving aberrant protein expression or biological activity. The polymers biodivers in the superior of diagnostics as expressed sequence tags of the restore normal activity of (II) or to treat disease states involving control and its binding partners are useful in gene therapy techniques (II). (II) is useful in gene therapy techniques (II). (II) and its binding squinst it, detecting or consistent expressing (II). (I) and (II) are useful in medical consistent expression or biological activity. (II) and (III) are useful for treating (III) and (III) are useful for treating (III) are useful for treating (III) are useful for treating (III). (II) and (III) are useful for treating (III) are useful activity. (III) are useful activity. (III) are useful activity. (III) are useful for medical activity. (III) are useful for medical activity. (III) are useful for treating (III) are useful for medical activity. (III) are useful for treating (III) are useful for treating (III) are useful for medical activity. (III) are useful for treating (III) are useful for treating (III) are useful for medical activity. (III) are useful for treating (III) are useful for treating (III) are useful for medical activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                        AAW79463-67 represent Staphylococcus aureus WCHU (NCIMB 40771) proteins that have homology to a Cowpea extensin-like protein fragment. The S. aureus proteins are used to generate antibodies and to screen for antimicrobials. The products are used to treat or prevent bacterial infections, particularly where caused by S. aureus but also against Helicobacter pylori. Particular applications are to treat subjects before surgery or insertion of an in-dwelling device (alternatively the device itself is impregnated before placement). The nucleic acid sequence is used as sources of antisense sequences (for therapeutic use) or regulatory elements for controlling expression of bacterial genes, and for antibacterial screening. The protein can
                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                    Human bone marrow expressed probe encoded protein SEQ ID NO: 34724.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO200157272-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide #8569

The present sequence is a peptide encoded leach probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples deficed human placenta. The probes are useful for antenatal diagnosis human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                WPI; 2000-602362/57.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; can tithyroid; and antianemmic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy evertors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritts, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc in the specification). ABN15762 to ABN27252 encode the human ORFX cc proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated cc disorder in humans, and in the manufacture of a medicament for treating a gaydrome associated with ORFX-associated disorder. ORFX polynucleotide csequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, costeoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders systemic clupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders; infectious carthritis, autoimmune disorders such as multiple sclerosis, rheumatoid carthritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, conceded and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, conceded and autoimmune the providers and conditions resulting from the sequence data for this patent of degeneration from various tissues and conditions resulting from constending cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

ABN15762 to ABN27252 encode the human ORFX CC proteins given in ABP00010 to ABP11500. ORFX proteins are useful for CC treating or preventing a pathology associated with an ORFX-associated CC disorder in humans, and in the manufacture of a medicament for treating a cc sequences can be used in gene therapy. ORFX sequences can be used in the cc treatment of cancer, hyperproliferative disorders, cirrhosis of liver, cc psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, cc steoarthritis, neurodegenerative disorders, disorders, haemorrhage, cc steoarthritis, neurodegenerative disorders, cirrhosis of liver, cc psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, cc steoarthritis, neurodegenerative disorders, cirrhosis or organ cransplantation, cardiovascular diseases, diabetes mellitus, systemic cc lupus erythematosus, hypertension, hypothyroldism, cholesterol ester cc storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host clisease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, chemical disease, and for gut corporative disorders, or periodontal disease, and for gut creperfusion injury in various tissues and conditions resulting from cc systemic cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA).

Note: The sequence data for this patent did not form part of the printed as pecification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunoger polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central

The invention relates to novel excretory system related human polynucleotides (AAI98507-AAI99503) and the encoded proteins (AAM995913) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy, especially disorders related to the excretory system. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast
                                                                                                                                                                        Claim
                                                                                                                                                                                                                               Isolated
                                                                                                                                                                                                         ín
                                                                                                                                                                                                                                                                 2001-465569/50.

The invention relates to novel kidney related polynucleotides (AAM52971-AAM63793) and the encoded polypeptides (AAM2417-AAM42691) CC collectively known as kidney antigens and the use of such kidney antigens CC for detecting disorders of the kidney, especially kidney cancer and CC kidney cancer metastases. The polynucleotides and proteins are also CC useful for preventing, treating or ameliorating medical conditions CC e.g. by protein or gene therapy. The genes are isolated from a range CC proteins, antibodies and (ant)agonists are useful in the diagnosis, CC treatment tand prevention of: (a) cancer, e.g. breast and ovarian cancer, CC and other cancers of the adrenal gland, bone, bone marrow, breast, CC gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders CC e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, CC autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple csclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound CC healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases useh as viral, bacterial, fungal and CC parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-NOV-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SXCC
                       CC AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST)
CC sequences, corresponding to human secreted proteins. AAX64651 to
CC AAX65438 represent the EST-related proteins corresponding to AAZ42265 to
CAAX3052. The 5' ESTS can be used for producing secreted human gene
CC products. They can be used to identify and isolate 5' untranslated
CC regions (UTRs) and upstream regulatory regions which control the
CC location, development stage, rate, and quantity of protein synthesis, as
CC well as stability of mRNA. The ESTs are also useful as probes for
CC chromosome mapping, and to obtain full length cDNA clones. The ESTs can
CC diagnostic procedures to identify individuals, or in
CC diagnostic procedures to identify individuals having genetic diseases
CC resulting from abnormal gene expression. The products may also be used in
CC used for directing extracellular secretion of a polypeptide or the
CC insertion of a polypeptide into a membrane, or importing a polypeptide
CC into a cell. The proteins encoded by the EST sequences may be useful in
CC treating a variety of human conditions. Secreted proteins have
CC valuable. AAZ42249 to AAZ42264 and AAX64644 to AAX64650 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SO
                                         CC polypeptide (II) sequences. (I) is useful as hybridisation probes,
CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome
CC and gene mapping, and in recombinant production of (II). The
CC polynucleotides are also used in diagnostics as expressed sequence tags
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC to restore normal activity of (II) or to treat disease states involving
CC (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
CC a food supplement. (II) and its binding partners are useful in medical
CC imaging of sites expressing (II), (I) and (II) are useful for treating
CC disorders involving aberrant protein expression or biological activity.
CC The polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. ABG00010-ABG30377 represent novel human
CC diagnostic amino acid sequences of the invention.
CC specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                              The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM/8323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny, inhibit activity and may be useful in the diagnosis and/or treatment of career leverage activity and may be useful in the diagnosis and/or treatment of career leverage activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                        pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity

                                                                         Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in CC the treatment, prevention and diagnosis of medical conditions caused by CP acnes. The disorders include SAPHO syndrome (synovitis, acne, CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. CC P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the CC presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention CC and determining the amount of bound protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies CC specific for P. acnes proteins. These antibodies can be used to CC downregulate expression and activity of P. acnes polypeptides and CC therefore treat P. acnes infections. The antibodies may also be used as CC diagnostic agents for determining P. acnes presence, for example, by CC enzyme linked immunosorbent assay (ELIAA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local

                                                                                   presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                  Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the
